Sample Biostatistics Exam Questions and Detailed Answers

Preparing for exams involves practicing questions and understanding their solutions. Here are some example questions with comprehensive answers:

Question 1: What is the difference between the mean and median? When should each be used?

Answer:

The mean is the arithmetic average of a dataset, calculated by summing all values and dividing by the number of observations. It is sensitive to extreme values (outliers), which can skew the average.

The median is the middle value when data are ordered from smallest to largest. If there is an even number of observations, it is the average of the two middle values.

When to use each:

- Use mean when data are symmetrically distributed without outliers.
- Use median for skewed data or when outliers are present, as it provides a better measure of central tendency in such cases.

Question 2: Explain the concept of p-value in hypothesis testing.

Answer:

A p-value is the probability of obtaining a test statistic at least as extreme as the observed value, assuming the null hypothesis is true. It quantifies the evidence against the null hypothesis.

- A small p-value (typically ≤ 0.05) indicates strong evidence to reject the null hypothesis.
- A large p-value suggests insufficient evidence to reject the null hypothesis.

In essence, the p-value helps determine the statistical significance of the results, guiding researchers in decision-making.

Question 3: Describe the assumptions underlying linear regression analysis.

Answer:

Linear regression analysis is based on several key assumptions:

- Linearity: The relationship between independent variables and the dependent variable is linear.
- Independence: Observations are independent of each other.
- Homoscedasticity: Constant variance of residuals across all levels of independent variables.
- Normality: Residuals are approximately normally distributed.
- No multicollinearity: Independent variables are not highly correlated with each other.

Violations of these assumptions can lead to unreliable estimates and invalid inferences.
