- The time delay and intensity of returning echoes are processed to create images.

Transducers and Image Formation

- Transducers serve as both the emitter and receiver of sound waves.
- Piezoelectric crystals within transducers convert electrical signals into sound waves and vice

versa.

- The reflected echoes are processed by the ultrasound machine to generate real-time images displayed on the monitor.

Image Resolution and Penetration

- Higher frequency transducers provide better resolution but less depth penetration.
- Lower frequency transducers are suitable for imaging deeper structures but with less detail.
- Selecting appropriate transducer settings is essential for optimal imaging.

Foundations of Veterinary Reproduction: Biological Principles and

Physiology

Understanding the reproductive system is fundamental before delving into clinical applications. Arthur S. emphasized the importance of a thorough grasp of reproductive physiology, including hormonal regulation, reproductive anatomy, and cyclicity across species.

Reproductive Anatomy and Species-Specific Variations

Different species exhibit unique reproductive anatomies that influence management strategies:

- Bovine Reproductive System: Characterized by a bicornuate uterus and a prominent cervix, which complicates artificial insemination and obstetric interventions.
- Equine Reproductive Anatomy: Features a long, flexible cervix and a relatively simple uterus, allowing different obstetric considerations.
- Small Ruminants and Swine: Possess distinct uterine horns and placentation types, affecting fetal development and delivery.

Arthur S. highlighted that a clinician's familiarity with these anatomies is critical for effective diagnosis and intervention.

Hormonal Regulation and Reproductive Cyclicity

A central component of his work centered around understanding the hormonal orchestration of the estrous cycle:

- Estrogen and Progesterone: Regulate follicular development, ovulation, and uterine environment.
- Luteinizing Hormone (LH) and Follicle-Stimulating Hormone (FSH): Govern follicular maturation and ovulation.
- Prostaglandins: Play key roles in luteolysis and cycle synchronization.

Arthur S. contributed to elucidating how hormonal imbalances could lead to reproductive failures, emphasizing the importance of hormonal assays and monitoring in clinical practice.

Diagnostic Techniques in Veterinary Reproduction

Arthur S. was instrumental in refining diagnostic tools that improve reproductive efficiency:

Ultrasonography

- Transrectal and Transabdominal Ultrasound: Allowed real-time visualization of follicles, corpora lutea, and fetal development.
- Applications: Early pregnancy diagnosis, ovulation timing, and detecting reproductive pathologies.

His research demonstrated that ultrasonography reduces reliance on more invasive or less accurate methods, enabling earlier and more accurate diagnosis.

Hormonal Assays and Blood Tests

- Progesterone Monitoring: Used to confirm ovulation, pregnancy, or luteal insufficiency.
- Luteinizing Hormone (LH) Tests: Timing insemination with natural or artificial induction of ovulation.
- Emerging Biomarkers: Arthur S. advocated for the integration of novel biomarkers, such as pregnancy-associated glycoproteins (PAGs), to improve early pregnancy detection.

Palpation Techniques

While largely supplanted by ultrasonography, rectal palpation remains a vital skill, especially in resource-limited settings. Arthur S. emphasized combining palpation with other diagnostic modalities for accurate assessment.

Reproductive Management and Breeding Programs

Arthur S. championed strategic reproductive management to improve herd productivity:

Estrus Synchronization

- Protocols: Use of prostaglandins, progestins, and gonadotropins to align estrous cycles.
