Sample USMLE Dermatology MCQs and Explanation

To illustrate the style and depth of USMLE dermatology MCQs, here are some sample questions with detailed explanations:

Question 1:

A 45-year-old woman presents with sharply demarcated, erythematous, scaly plaques on her elbows and knees. She reports recent stress and uses topical corticosteroids. What is the most likely diagnosis?

- A) Psoriasis
- B) Eczema
- C) Tinea corporis
- D) Contact dermatitis

Answer: A) Psoriasis

Explanation: The presentation of well-demarcated, erythematous, scaly plaques on extensor surfaces like elbows and knees is characteristic of psoriasis. Stress can exacerbate psoriasis. Topical corticosteroids are common treatments. Eczema typically affects flexural areas, and tinea has a different appearance with a more annular, scaling border.

Question 2:

A 30-year-old man presents with a rapidly growing, asymmetrical pigmented lesion with irregular borders and multiple colors. Which of the following features best supports a diagnosis of melanoma?

- A) Symmetry of the lesion
- B) Uniform color
- C) Diameter less than 6 mm
- D) Irregular borders and variegated pigmentation

Answer: D) Irregular borders and variegated pigmentation

Explanation: The ABCDE criteria for melanoma include Asymmetry, Border irregularity, Color variation, Diameter >6 mm, and Evolving features. Irregular borders and multiple colors are classic signs of melanoma. Symmetry and uniform color suggest benign nevi.

- Pemphigus vulgaris presents with flaccid blisters but may not involve mucous membranes initially.
- Bullous pemphigoid tends to occur in older patients with tense blisters and less mucous membrane involvement.
- Herpes zoster causes dermatomal vesicular eruptions, not widespread blistering.

Correct answer: B) Stevens-Johnson syndrome

Tips for Excelling in USMLE Dermatology MCQ

- Memorize characteristic features of common dermatological conditions.
- Understand disease associations (e.g., psoriasis with psoriatic arthritis).
