Understanding Integral Equations

What Are Integral Equations?

Integral equations are equations in which the unknown function appears inside an integral. They typically take one of the following forms:

- Fredholm Integral Equations: Involving integrals over a fixed range.

[

$$f(x) = \lambda \int_a^b K(x, t) \phi(t) dt + g(x)$$

]

[

$$\phi(t) = f(t) + \lambda \int_a^t K(t, s) \phi(s) ds$$

]

Here, $K(x, t)$ or $K(t, s)$ is called the kernel function, and $\phi(t)$ is the unknown function to be determined.

Types of Integral Equations

Integral equations are classified based on various criteria:

- Linear vs. Nonlinear:

What Are Elementary Differential Equations?

At their core, elementary differential equations are equations involving derivatives of an unknown function with respect to one or more variables. They are classified based on the order (the highest derivative present), linearity, and the type of functions involved. These equations often appear in problems where the rate of change of a quantity depends on the quantity itself or other related quantities.

Types of Differential Equations

Differential equations can be broadly categorized into:

- Ordinary Differential Equations (ODEs): Involve derivatives with respect to a single independent variable.

This guide focuses on elementary ordinary differential equations, which are typically introduced early in calculus and differential equations courses.

Basic Forms of Elementary Differential Equations

Understanding the structure and types of elementary differential equations is crucial for solving them effectively.

These involve the first derivative of the unknown function:

$$\left[\frac{dy}{dt} = f(t, y) \right]$$

Common forms include:

- Separable equations: Can be written as $\frac{dy}{dt} = g(t)h(y)$
- Linear equations: Of the form $\frac{dy}{dt} + p(t)y = q(t)$
- Exact equations: Satisfy a specific condition allowing them to be integrated directly.

Higher-Order Differential Equations

These involve derivatives of order two or higher, such as:

$$\frac{d^2 y}{dt^2} + p(t) \frac{dy}{dt} + q(t)y = r(t)$$

While more complex, many techniques for first-order equations extend to higher orders.

Methods for Solving Elementary Differential Equations

Different types of elementary differential equations require different solution techniques. Understanding these methods allows for systematic problem-solving.

- Separation of Variables

Applicable to: Separable equations.

Approach:

- Rewrite the equation as $\frac{dy}{dt} = g(t)h(y)$
- Rearrange to isolate variables:

$$\frac{1}{h(y)} dy = g(t) dt$$

- Integrate both sides:

$$\int \frac{1}{h(y)} dy = \int g(t) dt + C$$

Example:

Solve $\frac{dy}{dt} = y$

Solution:

$$\left[\frac{dy}{y} = dt \right]$$

$$\left[\ln|y| = t + C \right]$$

$$\left[y = \pm e^{t+C} = Ce^t \right]$$

- Integrating Factors (for Linear Equations)

Applicable to: First-order linear equations.

Form:

$$\left[\frac{dy}{dt} + p(t)y = q(t) \right]$$

Approach:

- Find the integrating factor:

$$\left[\mu(t) = e^{\int p(t) dt} \right]$$

- Multiply the entire differential equation by $\mu(t)$:

$$\left[\mu(t) \frac{dy}{dt} + \mu(t) p(t) y = \mu(t) q(t) \right]$$

- Recognize the left side as the derivative of $\mu(t)y$:

$$\left[\frac{d}{dt} [\mu(t)y] = \mu(t) q(t) \right]$$

- Integrate both sides:

$$\left[\mu(t)y = \int \mu(t) q(t) dt + C \right]$$

- Solve for y :

$$y(t) = \frac{1}{\mu(t)} \left(\int \mu(t) q(t) dt + C \right)$$

- Homogeneous Equations

Applicable to: Equations where functions are homogeneous of a certain degree.

Approach:

- Substitute $y = vx$ or similar to reduce to a simpler form.
- Use substitution to convert the equation into a separable form.

- Exact Equations

Applicable to: Equations of the form $M(t, y) + N(t, y) \frac{dy}{dt} = 0$, where M and N satisfy the exactness condition:

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial t}$$

Approach:

- Find a potential function $\Psi(t, y)$ such that:

$$\frac{\partial \Psi}{\partial t} = M(t, y)$$

$$\frac{\partial \Psi}{\partial y} = N(t, y)$$

- The solution is then given implicitly as:

$$\Psi(t, y) = C$$

Special Techniques and Considerations

While many elementary differential equations are straightforward to solve, some require more nuanced approaches.

- Substitutions

Transforming variables can simplify complex equations.

- Bernoulli equations:

$$\left[\frac{dy}{dt} + p(t)y = q(t)y^n \right]$$

Use substitution $\left(z = y^{1-n} \right)$ to linearize.

- Homogeneous equations:

Substitution $\left(y = vx \right)$ or $\left(y/x \right)$ helps reduce to separable form.

- Series Solutions

When explicit solutions are difficult, power series methods can approximate solutions near a point.

- Numerical Methods

For equations without closed-form solutions, methods like Euler's method or Runge-Kutta algorithms provide approximate solutions.
