Applying the Principles: A Closer Look at Key Topics

Time Value of Money (TVM)

The solutions often involve calculating present and future values using formulas such as:

- $PV = \frac{FV}{(1 + r)^n}$
- $FV = PV \times (1 + r)^n$

where PV is present value, FV is future value, r is the discount rate, and n is the number of periods.

Sample solution approach:

- Identify the known variables.
- Determine the appropriate formula.
- Plug in the values and compute.
- Interpret the result in context.

Risk and Return

The solutions illustrate calculating expected returns and measuring risk through metrics like variance and standard deviation:

- Expected Return: $E(R) = \sum p_i \times R_i$
- Variance: $\sigma^2 = \sum p_i \times (R_i - E(R))^2$

These calculations help in understanding investment attractiveness and portfolio diversification.

Cost of Capital

The solutions guide students through calculating the weighted average cost of capital (WACC):

$$WACC = \frac{E}{V} \times R_e + \frac{D}{V} \times R_d \times (1 - T_c)$$

where:

- E = Equity value
- D = Debt value
- V = Total value ($E + D$)
- R_e = Cost of equity
- R_d = Cost of debt
- T_c = Corporate tax rate

Step-by-step, the manual demonstrates how to estimate each component accurately.

How the Solutions Enhance Learning and Application

Reinforcing Theoretical Concepts

By working through detailed solutions, students see how abstract theories translate into concrete calculations and decision-making tools.
